SENTINEL WEEKLY EDGE

The market was noisy.
Here is what held up.

Your seven-day field guide to the signals, the losses, the Solana tape, and what SENTINEL is improving for members next.

CORE PF 0.84 NO SCALE-UP	**SOLANA $10.55B** ACTIVE / COOLING	**TOP RECEIPT +28.29%** RESEARCH LAB

SUBSCRIBER EDITION // 12-18 JULY 2026

Loss-first. Evidence-backed. No auto-execution.

Data frozen 18 Jul 23:04 UTC. The final UTC day is partial.

01 // YOUR WEEK IN 60 SECONDS

The edge was selective.

LiqSqueeze held up. Sweet did not. Research Lab produced the week's biggest winner and loss. Solana activity stayed large, but momentum cooled.

PF 0.84	Liq 1.11	$10.55B	None
CORE SCOREBOARD	BEST LIVE CORE	SOLANA ACTIVITY	MODEL PROMOTIONS
Below break-even across 91 resolved CORE signal outcomes.	Positive PF on 22 outcomes. Useful, not yet durable.	Rolling DEX volume, down 27.9% week over week.	No tier passed the Stable Edge threshold.

If you remember one thing

This was not a week to treat every alert equally. LiqSqueeze was the strongest live CORE lane; Sweet needs caution; Super stays inside Research Lab; Alpha stays off.

What worked for members

- LiqSqueeze resolved at PF 1.11 with a 54.5% positive-close rate.
- Every positive and non-positive close remained visible in the receipt ledger.
- Telegram's **/tiers** view now exposes 24h, 7d, and 14d scoreboards on demand.
- The Pump.fun Radar stayed fresh with live recorder and source-health visibility.

Where to stay cautious

- Sweet resolved at PF 0.71 and was the main CORE drag.
- Super's live ledger was positive, but its current-route diagnostic was weak.
- No model produced a stable rolling edge across all eight windows.
- Hot memecoin pools showed extreme reversals against thin liquidity.

Your practical read

- Check **/tiers** before treating a recent streak as a change in model quality.
- Read LiqSqueeze as the best current CORE lane, not a permission to increase risk.
- Use Research Lab as evidence gathering, not as a substitute for CORE discipline.
- The LAB reversal shows that a prior winner does not validate a later signal.

02 // YOUR MODEL MAP

Know which lane you are looking at.

The labels below translate four different evidence sets into the member-facing answer: live, watch, lab, or off.

MODEL	MEMBER STATUS	7D RESOLVED LEDGER	PLAIN-ENGLISH READ
LiqSqueeze	**LIVE**	n=22 PF 1.11 avg +0.26%	**Best current CORE** Positive ledger, but the sample is still thin.
Sweet	**LIVE / WATCH**	n=69 PF 0.71 avg -0.46%	**Use selectively** This week's main CORE drag.
Super	**LAB**	n=105 PF 1.29 avg +0.46%	**Promising, inconsistent** Strong ledger; weak current-route check.
Alpha	**OFF**	n=117 PF 0.92 avg -0.23%	**Correctly paused** No customer routing until evidence changes.

Why CORE looks weaker than the full ledger

The 196-outcome resolved delivery-stream total includes Super from Research Lab. Super lifted the all-stream PF to 1.07. The actual CORE experience - Sweet plus LiqSqueeze - was 91 outcomes at PF 0.84.

How to read the next alert

WHEN YOU SEE	READ IT AS	CHECK BEFORE YOU CARE
LiqSqueeze	The best current live CORE lane	Sample size, current regime, stop distance, and recent 14d receipt
Sweet	A live lane under review	Whether recent losses are clustering by symbol or regime
Super	A Research Lab observation	Ledger versus route-simulation divergence
Alpha	A paused audit record	Nothing - it is not customer-routed

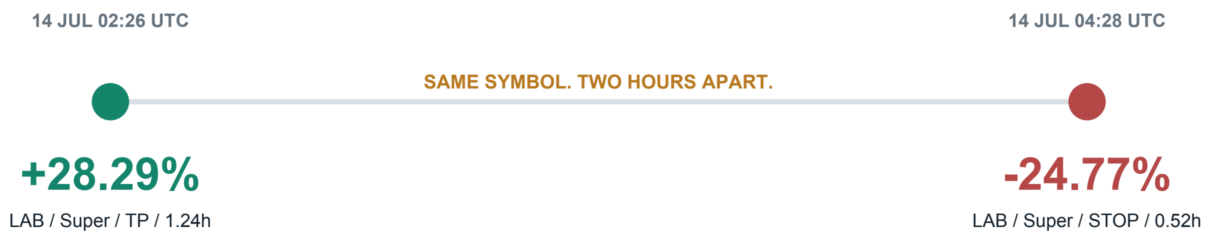
Member boundary

LIVE does not mean guaranteed. LAB does not mean promoted. OFF means no customer routing. SENTINEL never executes a trade for you.

03 // SIGNAL REPLAY

The winner became the warning.

LAB / Super delivered the week's best and worst resolved delivery-stream outcomes on the same morning. The sequence shows that a prior winner does not validate a later alert.



What happened

The first LAB entry resolved at +28.29% after 1.24 hours. A later LAB entry, just over two hours after the first, stopped at -24.77% in 0.52 hours. Both occurred while BTC was labelled FLAT.

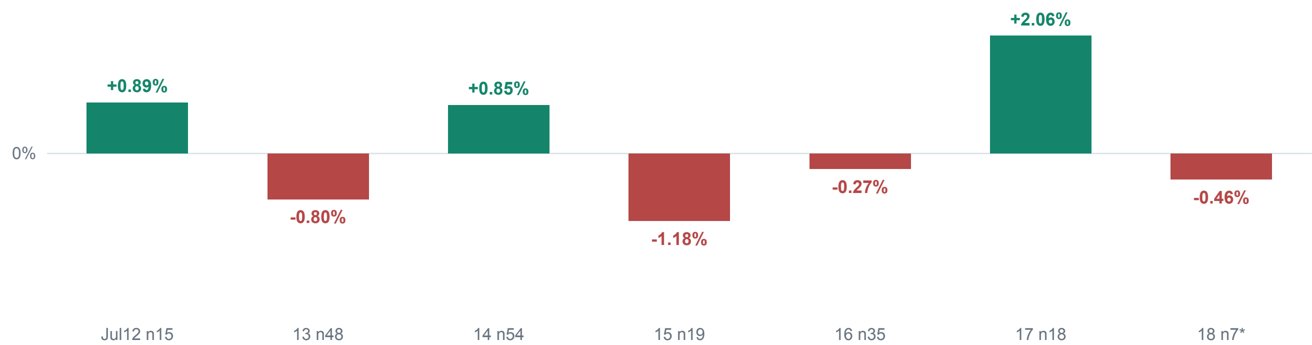
CORE highlight

- BLAST / LiqSqueeze: **+13.40%**, TP, 1.15h hold.
- The positive result supports LiqSqueeze's weekly lead, but remains one observation.

CORE lowlight

- LAB / Sweet: **-10.78%**, STOP, 1.12h hold.
- The loss fits Sweet's broader weekly drag and is not hidden behind the winner.

Average resolved outcome per signal - CORE + Research Lab



Member lesson

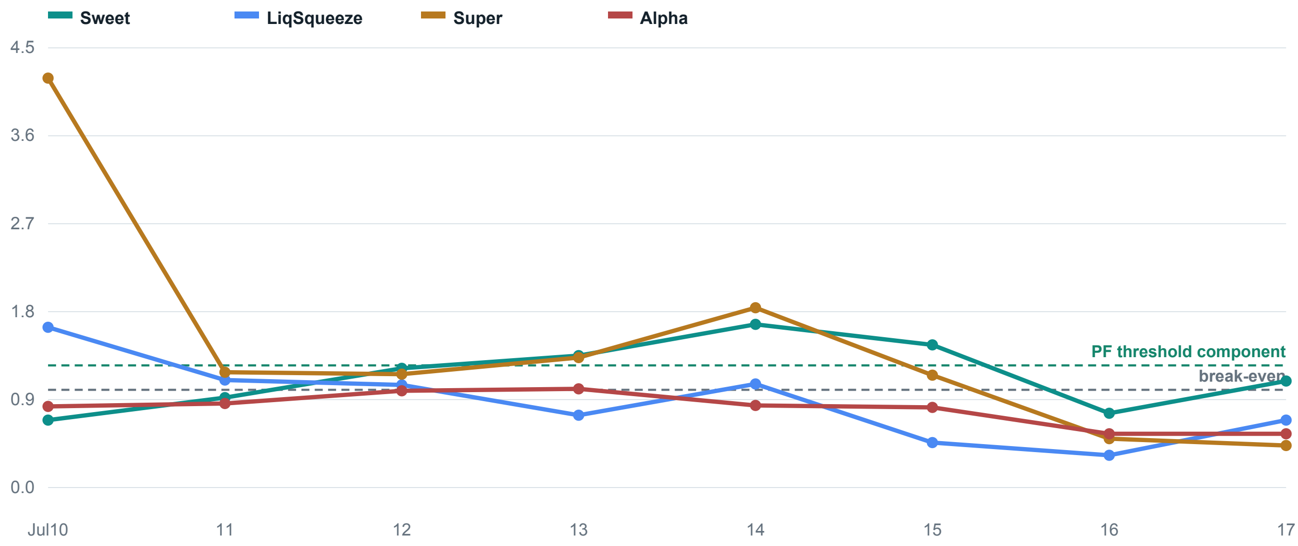
The week was episodic, not smooth. Jul 17 was strong, but four other slices were negative. Use the scoreboard to resist recency bias in either direction.

* Arithmetic mean net signal outcome by entry day, not daily portfolio return, customer profit or loss, or CORE-only performance. Jul 18 is partial. Outcomes use close-only snapshots and are not execution fills.

04 // CONFIDENCE CHECK

Did the edge travel across windows?

We moved a seven-day test forward one day at a time. A durable model should stay above break-even across changing windows, not only inside its best week.



MODEL	ROLLING READ	PLAIN VERDICT	MEMBER STATUS
Sweet	PF median 1.16; 62.5% profitable	Nearest, but only marginal	LIVE / WATCH
LiqSqueeze	PF median 0.90; 50.0% profitable	Current week stronger than history	LIVE / MONITOR
Super	PF median 1.17; very high variance	Too inconsistent for promotion	LAB
Alpha	PF median 0.84; 12.5% profitable	No edge	OFF

The honest answer

Zero models passed Stable Edge. That does not make every signal useless; it means none earned a broader promise or a scale-up from this evidence.

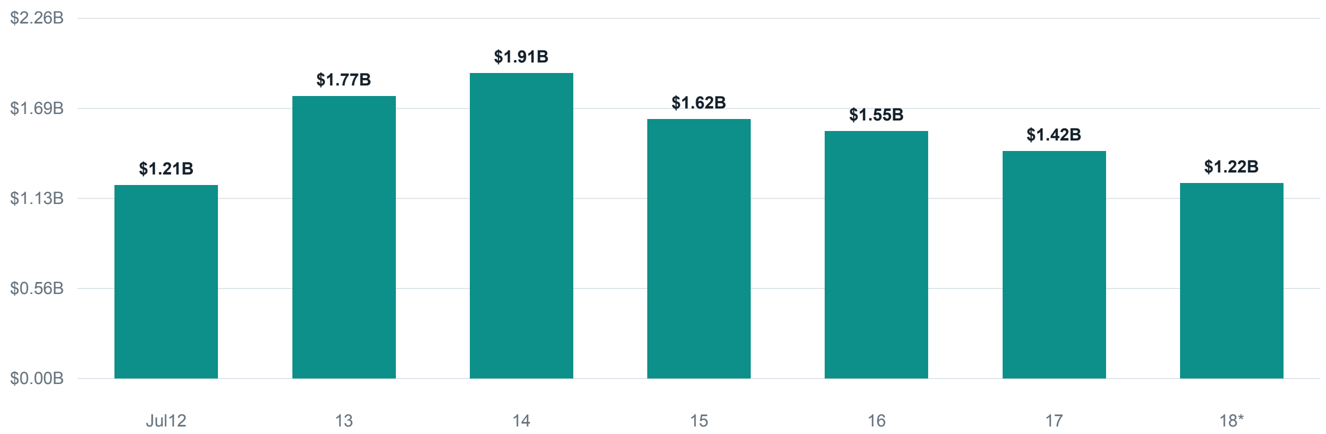
Adjacent windows overlap by six days, so summed diagnostic counts repeat observations. The source backup spans 3 Jul 21:00 to 17 Jul 20:17 UTC and contains no 18 Jul data; the newest window can label TIME_UP at the last available bar before the full hold horizon. This is a stability test, not a second customer ledger.

05 // SOLANA PULSE

Still busy. Clearly cooler.

Solana moved billions, but the pace slowed. Pump venues still captured more than a quarter of DEX activity, keeping launch-token flow important and highly competitive.

-2.0%	$10.71B	-27.9%	27.4%
SOL WEEK MOVE	OBSERVED DEX VOLUME	ROLLING PACE	PUMP VENUE SHARE
$76.99 to $75.45; range $74.08-$78.17.	Jul 12-18 sum through the evidence freeze.	$10.55B versus $14.64B prior rolling week.	PumpSwap + pump.fun venue proxy.



What this means for your Radar read

- Falling chain-wide volume can shorten the life of momentum bursts and increase competition for the same liquidity.
- Pump venues remain meaningful at 27.4% of Solana DEX volume, so launch-token flow is still worth monitoring.
- Venue share is a proxy, not a pure memecoin count. SENTINEL will not relabel it as all memecoin activity.
- Thin-liquidity pools can print large volume and still reverse violently within one or six hours.

Member stance The evidence favors a more selective read: liquidity, holder, and reversal context matter more when momentum cools.

06 // MEMECOIN FIELD NOTES

Hot tape. Thin exits.

These were live trending-pool risk examples at the evidence freeze - not SENTINEL picks and not a market-wide ranking.

POOL	24H VOLUME	LIQUIDITY	24H MOVE	SHORT-HORIZON MOVE	HOLDER READ
Jimothy	$25.83M	$350.7K	+87%	-20% / 6h	Top10 ~12.4%*
ANSEM	$9.64M	$1.98M	+8.9%	+12.8% / 6h	>=61.8% observed**
Mouse	$5.31M	$47.3K	+954%	-70.5% / 6h	Top10 ~18.4%*
Benny	$3.84M	$37.9K	+511%	-55.0% / 1h	Top10 ~15.6%*
Tilly	$3.24M	$46.0K	+1,293%	-23.2% / 6h	Top10 ~19.3%*

Radar positives

- The public preview was fresh with 20 current rows.
- Pump.fun, advanced feed, DexScreener, RugCheck, Solana RPC, Jupiter, and engine were available.
- The recorder was running with fresh observations at the evidence freeze.

Risk flags

- Volume-to-liquidity exceeded 100x on Mouse and Benny.
- ANSEM's bounded Helius scan found one observed non-pool owner at 58.3% of supply.
- Birdeye was unavailable; absent enrichment stayed labelled unavailable.

Three Radar checks that separate attention from noise

1. Is the liquidity real enough for an exit? 2. Is holder concentration known, or merely missing? 3. Is the move still expanding, or already reversing on the one-hour tape?

* Simple pool-excluded top-10 estimate. ** ANSEM scan stopped at 25,000 accounts after observing 68.36% of supply; the concentration figure is a lower bound, not a complete distribution.

07 // YOUR MEMBERSHIP

What is live, preview, and next.

Two member-facing proof surfaces were live this week: /tiers and the loss-first ledger. Radar v2 remains an owner/admin preview, while Pine v1.4 remains pending.

MEMBER SURFACE	STATE	BENEFIT	HONEST BOUNDARY
Telegram /tiers	LIVE	Pull 24h, 7d, or 14d model receipts without waiting for the Sunday digest.	Use it before judging a streak.
Loss-first ledger	LIVE	Positive and non-positive resolved outcomes remain visible with tier boundaries.	The worst result cannot disappear behind the average.
Radar v2	PREVIEW	Cleaner terminal, safer holder replay, bounded enrichment, and explicit source health.	Owner/admin preview; member cutover is not yet claimed.
Pine v1.4	PENDING	Logic and 92 parity checks are complete.	Protected scripts and alerts still require owner republishing.
Wallet access	LIVE CONTRACT	Wallet-first access and server-side session revocation exist.	This week's acquisition funnel still produced no starts.

What is coming next

- **Pulse + Token Focus:** faster movement from market overview to one-token evidence.
- **Better holder columns:** clearer separation of known concentration, adjusted estimates, and unavailable data.
- **Mobile refinement:** more usable Radar review away from desktop.
- **Member cutover proof:** v2 will not replace the current member terminal until access, alert, mobile, and receipt parity pass.
- **Model truth:** Sweet loss review, LiqSqueeze stability, Super route reconciliation, and Alpha retirement stay ahead of new promotion claims.

The promise

More proof before more access. A merged feature is not described as delivered until the member path is live and verified.

08 // BEHIND THE SIGNAL

Missing data stayed missing.

The paid-data stress test produced healthy bounded Helius probes and one hard Birdeye limit. SENTINEL showed the difference instead of turning an unavailable field into a false zero.

Running	Probes healthy	CU limit	Disabled
RADAR RECORDER	HELIUS	BIRDEYE	X ENRICHMENT
Fresh at the evidence freeze; storage pressure normal.	Sampled reads returned HTTP 200; quota balance unverified.	Five tested endpoints returned quota exhausted.	Paid-read leak contained; no hidden fallback.

What Helius delivered

- Bounded health, supply, asset, account, and holder probes returned HTTP 200 with no 429s.
- Bounded concentration evidence for Jimothy, Mouse, Tilly, Benny, and ANSEM.
- Exact credits used and remaining were not available without a Helius project ID.

What Birdeye blocked

- Credits, OHLCV, overview, trending, and meme-list reads all returned CU limit exceeded.
- No exact weekly launch or graduation count was published.
- No upgrade is justified until endpoint-level metering exists.

Why this matters to a subscriber

Data quality is part of the product. 'Unknown' protects you better than a confident number created from a failed provider call.

Current service stance

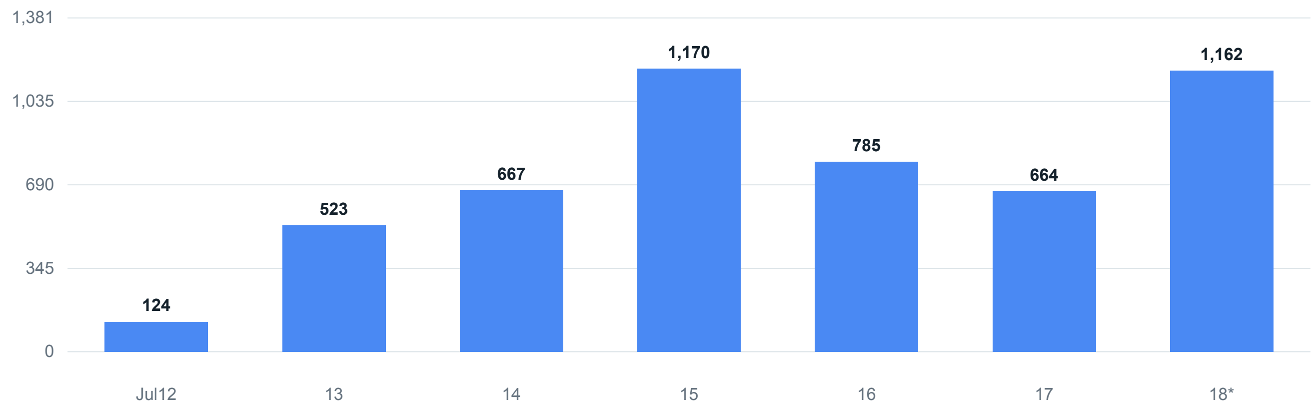
- Keep Helius reads bounded and move the next Radar phase to filtered subscriptions.
- Meter Birdeye compute units by endpoint before considering more spend.
- Keep X data calls disabled until every caller shares the same cap and ledger.
- Keep member-facing data fail-closed while the next scale safeguards are added.

09 // COMMUNITY PULSE

More eyes. No vanity victory lap.

Traffic grew, Radar attracted the clearest interest, and the measured acquisition funnel still produced no conversion. That is the customer-safe read.

5,095 EDGE PAGE VIEWS +34.4% versus the prior week.	**881** EST. RADAR PATHS Adaptive sampled estimate; not an exact request count.	**25** MEASURED LANDINGS Instrumentation mostly began 17 Jul.	**0** NEW CTA / TRIAL / PAID STARTS No new measured starts in this window.



Encouraging

- Radar produced 20 of the 25 tagged landings after measurement shipped.
- Proof surfaces produced nine trackable visits.
- More of the site is now measurable without mutating customer proof.

Not proven

- Cloudflare traffic is contaminated by bots, scanners, and owner/ops activity.
- No clean human-only or organic-search visitor count exists yet.
- The only measured X root reached 68 impressions and one reply.

Why members should care

Sustainable growth matters, but buying reach before measuring activation would take budget away from product and data quality. Spend stays paused until a full comparable funnel week exists.

10 // NEXT-WEEK PLAYBOOK

Five things we are watching for you.

The next report should answer whether this week's selective edge was the start of a pattern or just another noisy slice.

#	WATCH	QUESTION	SENTINEL RESPONSE
01	LiqSqueeze	Does PF stay above 1.0 as the sample grows?	Keep live and monitored; no scale-up from 22 rows.
02	Sweet	Do losses persist by regime or symbol cluster?	Review before any stronger member claim.
03	Super	Do ledger and current-route evidence converge?	Remain Research Lab until both agree.
04	Solana tape	Does rolling DEX volume stabilize after -27.9%?	A failure to stabilize would support a shorter-momentum regime read.
05	Radar data	Can Birdeye return under a metered budget?	Keep unavailable fields explicit until then.

Your three-minute member routine

1	2	3
CHECK THE RECEIPT Use /tiers or Performance before judging the last alert.	**CHECK THE CONTEXT** Open Pump.fun Radar for liquidity, holder, and reversal evidence.	**CHECK THE BOUNDARY** LIVE, LAB, and OFF are different promises. Interpret them accordingly.

What will not change

Alpha stays off. Super stays Lab. Losses stay visible. SENTINEL stays research-only and never auto-executes your trades.

Next issue

We will return with a larger LiqSqueeze sample, Sweet loss-cluster review, the next Solana volume read, a fully comparable growth week, and the latest Radar v2 member-cutover evidence.

11 // RECEIPTS AND DEFINITIONS

Your weekly receipt vault.

The report separates resolved signal outcomes, model diagnostics, and market snapshots so that none can masquerade as another.

LENS	WHAT IT ANSWERS	BOUNDARY
Resolved ledger	What signal entries from the week had resolved by the evidence freeze?	Primary customer proof; not an exchange fill or customer profit or loss.
Current-route simulation	What would today's rules have done on live history?	Pre-regime diagnostic; not delivered alerts
Walk-forward stability	Did the apparent edge survive moving seven-day windows?	Overlapping windows repeat observations
Market data	What was happening on Solana and live pools?	Time-sensitive snapshots and venue proxies
Growth data	Did attention become measured activation?	No clean human/bot split; instrumentation began late

Key definitions

- **PF:** gross positive signal outcomes divided by absolute gross negative outcomes. Above 1.0 is profitable in the tested sample, not guaranteed.
- **Positive close:** a resolved result above zero after the fixed 0.22% assumed round-trip cost.
- **Stable Edge:** PF median at least 1.25 and at least 75% profitable rolling windows. No model qualified.
- **CORE:** Sweet + LiqSqueeze. **Research Lab:** Super after acknowledgement. **Alpha:** paused audit stream.
